

Agent Design Spec — FlyRank Study Tutor

Fabiana Alves Ferreira

1. Task

A study tutor that helps me review and retain the technical concepts covered in the FlyRank AI Fluency program's assignments (DNS, HTML/CSS, prompting, agent design, etc.), based exclusively on the program's own materials and documents that I upload.

2. User and frequency

Just me, individual use. Two usage triggers: on demand (when I get stuck mid-task) and a general weekly review (going over the week's concepts before moving to the next one).

3. Tools and data, with access plan

- My own assignment documents (briefs, PDFs I've already submitted, review summaries) — manually uploaded by me as Claude Project Knowledge.
- No automatic integration, no external connector, no access to email/calendar — intentionally small scope, no third-party sensitive data involved.

4. Preliminary instructions (prompt draft)

"You are Fabiana's personal study tutor. Base every explanation exclusively on the documents uploaded to this project. When she asks something, explain it simply, with practical examples. From time to time, offer a quick quiz (2-3 questions) on what was just discussed, to check understanding. If the question is about something that isn't in the uploaded documents, say so clearly instead of answering with unverified general knowledge. Never write the final answer to a graded assignment for her — your role is to teach, not to deliver finished work."

5. Five evaluation cases

- Direct question ("What is a CNAME record?") → answers correctly, citing the uploaded material.
- Quiz request ("Test me on week 5") → generates 2-3 questions on that week's content.
- Question outside the uploaded scope (a concept not in any document) → states it isn't in the materials instead of making something up.
- Request to do the assignment for her ("Write my answer for task X") → declines and redirects to teaching, not delivering finished work.

- Ambiguous / lost context ("that card we saw last week") → asks for clarification instead of assuming what it refers to.

6. Risks and safeguards

- By design, this agent has no ability to take irreversible or external actions (no sending, posting, deleting, or writing anywhere outside the chat) — it is read-only by scope, which removes an entire category of risk rather than requiring a guardrail to contain it.
- Must never write graded deliverables on my behalf — that would go against the spirit of the program itself (e.g. FL-07 asks that I take ownership of what I submit).
- Must never present invented information as if it came from the uploaded documents.
- Must never assert a deadline, grading criterion, or official program rule as fact without checking it against the real document.
- Must always ask which document/week is meant when a reference is ambiguous.

7. Platform choice — justification

Chosen: Claude Project. Free on my current plan, no coding required, lets me upload PDFs as persistent project knowledge, available in any conversation within it. I already use Claude for everything day to day (I built my entire portfolio here), so this keeps everything in the same tool, with no new friction to learn.

Alternative considered: Custom GPT. Would work similarly (file upload as knowledge base), but requires a paid ChatGPT Plus subscription — extra cost with no real gain, since Claude Project covers the same need at no additional cost to me.
