

Draw the Path: Portfolio Sitemap + Toolkit

Fabiana Alves Ferreira

1. Portfolio sitemap

Four pages, each one directly supporting the proof statement and the single desired action (the data manager schedules a conversation). No extra page was added.

Page	Role in the journey	Essential content
Home	Entry point — states the proof statement and points to the single action	Hero copy with a condensed proof statement + call to action to schedule a conversation
Proof / case study	Core of the site — demonstrates the method with concrete evidence	Chile / TeleDesign story: illegible paper spreadsheets → street-by-street verification on Google Earth → network deployed with no field rework
About	Quick context on who Fabiana is and where she's headed	Transition from operations/SAP/RPA to junior Data/Analytics; Univesp in progress; focus on Data Quality and Automation. Updated after the stress test (Section 4): added a brief 'currently applying this' bridge — Univesp coursework, PI2/PI4 projects, Python/SQL practice — plus a linked resume, so the Chile judgment reads as backed by current technical skill.
Contact	Single destination — converts interest into a scheduled conversation	Link/button to schedule a conversation; email and LinkedIn

2. Free toolkit

3. Claude Project — custom instructions

Project created in claude.ai under this build's name (FlyRank AI portfolio), configured to act as a tutor across the eight weeks. Custom instructions pasted into the project:

You are my tutor for this portfolio project, which runs for 8 weeks (FL-01 to FL-08). My proof statement is: "I identify inconsistencies in raw data and verify information against reliable sources before they cause rework or real losses — like when I validated illegible addresses for a network project in Chile, street by street, using Google Earth, preventing technicians from having to return to the field. I'm demonstrating this to a data manager evaluating candidates for a junior role, so that he schedules a conversation with me.". The main desired action is for a data manager to schedule a conversation with me.

At every step, your job is to: (1) check whether what I'm building is genuinely tied to my proof statement and to the single action, flagging anything that feels generic or disconnected; (2) never invent or exaggerate facts from my story (Chile/TeleDesign) or any other professional experience; (3) push back when I add something "just because" that doesn't serve the proof or the action.

Criar instruções para o projeto

Dê ao Claude instruções e informações relevantes para as conversas dentro de Portfólio FlyRank AI. Isso funcionará junto com suas [instruções do perfil](#) e o estilo selecionado em um chat.

Who I am:

Fabiana Alves Ferreira. Transitioning careers into the Data field. Studying Data Science at Univesp (3rd year). AI Intern at FlyRank AI. Prior experience in operations, process automation (RPA/UIPath), and enterprise systems (SAP, ERP, CRM). Looking for a junior role in Data, Analytics, or Process Automation.

Proof Statement (Week 1):

I identify inconsistencies in raw data and verify information against reliable sources before they cause rework or real losses — like when I validated illegible addresses for a network project in Chile, street by street, using Google Earth, preventing technicians from having to return to the field. I'm demonstrating this to a data manager evaluating candidates for a junior role, so that he schedules a conversation with me.

Honest Sentence:

A resume or LinkedIn profile can list that I worked with data and SAP — but they can't prove that, faced with ambiguous information and no way to confirm it with the source, I don't move forward until I'm certain; my portfolio exists to show that story, not just mention it.

The proof story (Chile / TeleDesign Telecomunicações):

The proof story (Chile / TeleDesign Telecomunicações)

At TeleDesign Telecomunicações, working on HFC network project drawings, the company landed its first international client (Chile). The project involved building an internet network from scratch — from field survey to installation. Field technicians manually filled out paper spreadsheets with street names, house numbers, and meter counts per house. I received these spreadsheets to digitize in Excel, but the handwriting was often illegible (confusion between 5 and 3, s and r, indecipherable street names), with no way to confirm directly with the technicians in Chile. Solution: use Google Earth to navigate street by street and visually confirm the information before finalizing the spreadsheet. Result: the network was deployed without major issues, with no field rework.

Target audience: A manager/recruiter evaluating candidates for a junior role in Data, Data Quality, or Operations.

Main desired action: For this person to schedule a conversation (interview) with me.

Reference job openings in progress:

Ab InBev — Data Quality Engineer (focus: Data Quality, ETL, SQL, Python, data testing)

reference job openings in progress:

Ab InBev — Data Quality Engineer (focus: Data Quality, ETL, SQL, Python, data testing)
Capgemini — Automation (focus: VBA, Advanced Excel, MS Access, RPA, Python as a differentiator)

How to help me on this project:

Never invent or exaggerate facts from the Chile story or any other professional experience — every detail must be exactly as it happened.

Help structure and review the portfolio website, resume, and presentation copy, always keeping my real voice, not a generic AI tone.

When reviewing text, flag anything that sounds generic or artificial and suggest how to make it more authentic.

Prioritize clarity, conciseness, and a direct connection to the Proof Statement in any content created.

4. Sitemap stress test

Prompt sent to the Claude Project to check the sitemap's resistance against the specific action and the claim:

Here's the sitemap I sketched: Home, Proof / case study, About, and Contact [briefly describe what each page contains]. My specific action is getting a data manager to schedule a conversation with me, based on this proof statement: "I identify inconsistencies in raw data and verify information against reliable sources before they cause rework or real losses — like when I validated illegible addresses for a network project in Chile, street by street, using Google Earth, preventing technicians from having to return to the field. I'm demonstrating this to a data manager evaluating candidates for a junior role, so that he schedules a conversation with me." Stress-test this sitemap: is there any page that doesn't directly support the proof or the action? Is an essential page missing for this specific visitor to reach the decision? Where would they most likely hesitate or leave before acting?

Test result (Claude's response):

Do all four pages directly support the proof or the action? Yes. None is a "nice to have" — Home routes attention, Proof/case study carries the evidence, About gives just enough context to make the story credible, Contact closes the loop. I wouldn't cut anything here.

Is an essential page missing? Not a whole page, but there's a real gap inside the current four: nothing on the sitemap shows current technical skill. The Chile story proves you have the underlying instinct — don't trust ambiguous data, verify against a source before it causes rework — but it's from telecom, pre-dates your data transition, and doesn't mention SQL, Python, or any tool a Data Quality Engineer role actually runs on day to day. A data manager reading only Home → Proof → About gets: "she has excellent judgment, but has she actually touched the tools this job requires?"

That's the hesitation point, specifically: right after Proof/case study, before Contact. They believe the story, but they don't yet have evidence that the instinct is applied with SQL/Python/ETL now — not just Excel and Google Earth in 2019-era telecom work. If that doubt isn't resolved on the page, they close the tab instead of scheduling.

Fix — no new page, extend About: Add a short "Currently applying this" block to About: Univesp Data Science coursework in progress, the PI2/PI4 capstone projects, Python/SQL practice — framed as the same verification discipline from Chile, now pointed at structured data. Keep it factual and brief; this isn't a second case study, just a bridge so the manager doesn't have to take the leap from "she was careful with paper spreadsheets" to "she can do this with SQL" on faith.

One more small thing: confirm your resume is linked somewhere (About or Contact) — for a junior technical role, a manager will want to cross-check tools/keywords fast, and if they have to email you to ask for it, that's friction right before the action you want.

Change made to the sitemap: Sitemap stays at four pages; About's content gets one added element — a brief "current technical work" bridge (Univesp / PI2 / PI4 / Python / SQL) — plus a confirmed resume link, to close the gap between the Chile story and today's skill set before the visitor reaches Contact.
