

The Plan to Keep Building

Fabiana Alves Ferreira

The next case

The next case in my portfolio will have a short description on the home page and the full write-up on the Case Study page, following the same format as the two cases I've already published (The problem → What I did → the result).

It's the PI IV project from Univesp. My group has 8 people, and the theme we chose was Meteorological Data Analysis for Forecasting Local Conditions for Free Flight Practice.

Problem: how to process large volumes of daily terrain-climate data to predict days with severe or unfavorable wind and weather conditions, for the safe practice of free flight at Rampa Leste in São Pedro.

Objective: develop software that analyzes and models local meteorological data to classify the operational risk level and support decision-making for free flight practice at Rampa Leste, São Pedro.

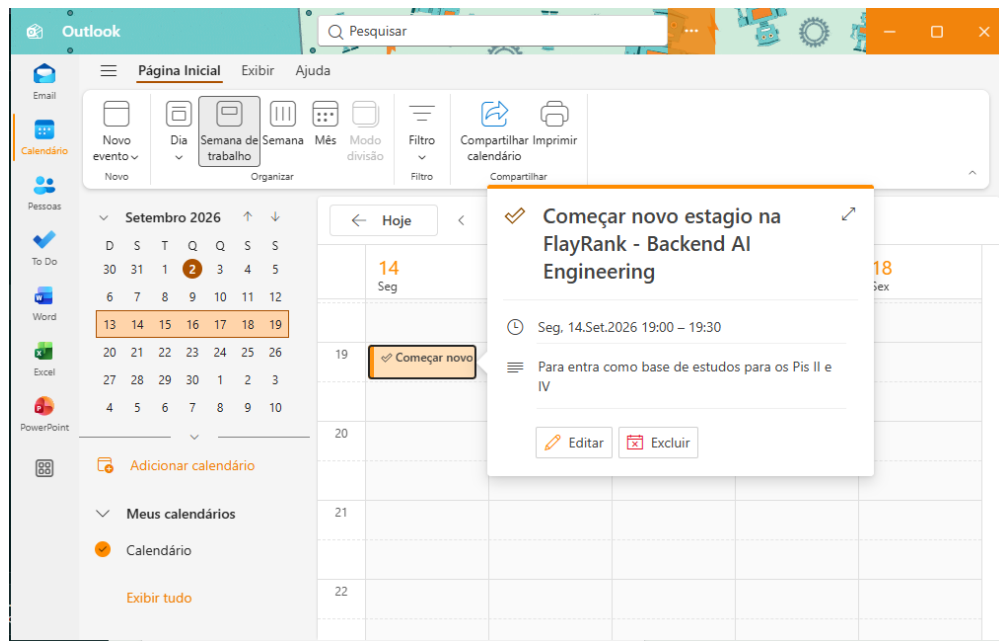

We haven't started building the software yet — we're still studying which tools we'll use. Once the software is functional, the case will be added to the site following the format above.

Named next piece of work

That's why my next step is the Backend AI Engineering internship track at FlyRank: to gain the tool knowledge I'll need to build the software.

Reminder evidence

Reminder set for 09/14/2026 in Outlook, with the note: "To serve as the study base for PI II and PI IV."

Screenshot: reminder set in Outlook for 09/14/2026.
